# C Score Game

Time limit: 2s

## Description

You will play a game with $\boldsymbol{N}$ objects and $\boldsymbol{M}$ buckets. Objects are numbered 1 to $\boldsymbol{N}$ and buckets are numbered 1 to $\boldsymbol{M}$.

Before the game starts, you will create a table with $\boldsymbol{N}$ rows and $\boldsymbol{N}$ columns. Each cell in this table contains a positive integer. The integer in row $i$ and column $j$ is denoted by $T_{i,j}$. The created table must be symmetric across its main diagonal. In other words, $T_{i,j}$ must be the same as $T_{j,i}$ for each pair of integers $i$ and $j$.

During the game, at each minute, you want to distribute $\boldsymbol{N}$ objects in $\boldsymbol{M}$ buckets. Each object must be in exactly one bucket. Bucket $k$ must contain exactly $\boldsymbol{A}_k$ objects. The *score* for a distribution is defined as the sum of $T_{i,j}$ for all pairs of objects $i$ and $j$ ($i \neq j$) that are in the same bucket.

For example, if $\boldsymbol{N} = 3$, $\boldsymbol{M} = 2$, $\boldsymbol{A}_1 = 2$, $\boldsymbol{A}_2 = 1$, and you created the following table of integers:

| | 1 | 2 | 3 |
|---|---|---|---|
| 1 | 9 | 1 | 2 |
| 2 | 1 | 5 | 3 |
| 3 | 2 | 3 | 2 |

- If you distribute object 1 and 2 in bucket 1 and object 3 in bucket 2, then the score of the distribution is $T_{1,2} = 1$.
- If you distribute object 1 and 3 in bucket 1 and object 2 in bucket 2, then the score of the distribution is $T_{1,3} = 2$.
- If you distribute object 2 and 3 in bucket 1 and object 1 in bucket 2, then the score of the distribution is $T_{2,3} = 3$.

You want to play the game as long as possible, with the condition that there must not be two distributions with the same score at two different minutes. Determine how many minutes you can play the game, if you want to play the game as long as possible. Since the duration of the game can be very long, print the remainder of the duration of the game in minutes divided by 998 244 353.

## Input

The first line contains two integers $\boldsymbol{N}$ and $\boldsymbol{M}$ ($1 \leq \boldsymbol{N} \leq 1\,000\,000; 1 \leq \boldsymbol{M} \leq 200\,000$) separated by a space. The second line contains $\boldsymbol{M}$ integers $\boldsymbol{A}_1, \boldsymbol{A}_2, \ldots, \boldsymbol{A}_{\boldsymbol{M}}$ ($0 \leq \boldsymbol{A}_k \leq \boldsymbol{N}; \sum_{k=1}^{\boldsymbol{M}} \boldsymbol{A}_k = \boldsymbol{N}$) separated by spaces.

## Output

The first line contains the remainder of the duration of the game in minutes divided by 998 244 353, if you want to play the game as long as possible.

| Sample Input 1 | Sample Output 1 |
|---|---|
| 3 2<br>2 1 | 3 |

| Sample Input 2 | Sample Output 2 |
|---|---|
| 4 5<br>1 0 1 1 1 | 1 |

| Sample Input 3 | Sample Output 3 |
|---|---|
| 3 1<br>3 | 1 |

## Explanation of samples

Sample input 1 matches the example in the description above.

In sample input 2, since all pairs of objects are in different buckets, the score of all distributions is 0. Therefore, you can only play the game for 1 minute.

In sample input 3, since all pairs of objects are in the same bucket, the score of all distributions is $T_{1,2} + T_{1,3} + T_{2,3}$. Therefore, you can only play the game for 1 minute.
